DATA SOURCE & NOTES

- Quantities come from stock_movements, the single source of truth: fuel in = measured Decantation Tank Lines, out = nozzle litres net of testing, adjustment = Tank Dip Variance; products in = Purchases, out = Product Sales, adjustment = Physical Count Variance.
- Stock value = closing × the product's current cost price (fuel VAT inclusive, since VAT is not claimable; products ex GST). No historical, weighted-average or FIFO cost.
- Category column, category subtotals and the Category filter (marked *). (needs: product category pick-list, group B)
- Reorder level, the Low stock flag and the "Low stock only" filter (marked *); fuel stays on Days of Cover. (needs: reorder level per product, group B)
