DATA SOURCE & NOTES

- Book figures come from the frozen DSR tank movement of each sealed Business Day (receipts = measured Decantation Tank Lines; sales = nozzle litres net of testing); Dip closing is that day's closing Tank Dip.
- Assumption: each day's Opening book is the previous day's Dip closing, so a Variance is booked once and never carries forward. Month Book closing = Opening + Receipts − Sales; net Variance = Dip closing − Book closing.
- Variance = dip − book (gain positive, loss negative), valued at the current cost price. A day is flagged when |Variance| exceeds 0.5% of litres sold (a Tank that sold nothing tolerates none); the limit is one app-wide value today (stock-variance.ts).
- Limit filter (marked *): a per-station Variance limit. (needs: per-station Variance limit setting, group B)
